Addiction, Recovery and Technology: An Outcome Study: William B. Secor, Davila, Richard D. Froilan, and Wolskee, Patricia, 2017

The most experienced Substance Use Disorder treatment providers are fully aware that effective treatment and the ongoing Recovery process are contingent upon the afflicted individual overcoming a myriad of multifaceted and dynamic challenges. Rather than relying solely on traditional treatment approaches, by integrating BioSound Therapy as a regular component in treatment, our patients and clients are more equipped to effectively face and work through challenges that would normally obstruct their progress.

The overwhelmingly positive results from the study and from our patients' experience, clearly demonstrate that BioSound Therapy is a highly effective modality that directly helps to target and deescalate resistance to treatment, helps to mitigate relapse, and aids in reducing impeding biological, psychological and emotional variables that obstruct the progressive development necessary for the successful treatment of Substance Use Disorders and its associated behaviors. To produce these results is one thing, but when our patients regularly request to use BioSound Therapy for their own benefit, it is both encouraging and promising for long-term Recovery.

Lawrence S Wilson, MD
